

# Artificial Intelligence Basics Course Summary

Generated by Scribe.AI

December 9, 2024

## 1 Key Terms

- **Minimax Search:** A search algorithm for two-player zero-sum games that aims to find the best move for the current player, assuming the opponent also plays optimally.
- **Alpha-Beta Pruning:** A technique to reduce the search space in Minimax search by avoiding the evaluation of branches that cannot affect the optimal decision.
- **Turing Test:** An operational test for intelligent behavior, the Imitation Game, where an interrogator tries to distinguish between a human and a machine based on their responses.
- **Game Tree:** A tree-like structure representing all possible sequences of moves in a game, with leaf nodes representing outcomes.
- **Perceptron:** A fundamental unit in neural networks that takes multiple inputs, applies weights to them, sums the weighted inputs, and produces an output based on a threshold.
- **Reinforcement Learning:** A type of machine learning where an agent learns to make decisions by interacting with an environment and receiving rewards or penalties.

## 2 Problem Types

- **Understanding the Nature of Intelligence:** This problem explores the definition and characteristics of intelligence, both human and artificial. It examines different perspectives on what constitutes intelligence and how it can be measured or simulated.
- **Defining Artificial Intelligence:** This problem involves formulating a precise definition of artificial intelligence, considering various perspectives and historical contexts. It explores the differences between simulating human thought processes and achieving intelligent behavior.
- **Evaluating Intelligent Behavior:** This problem focuses on developing methods for evaluating the intelligence of artificial systems. It examines the Turing Test and its limitations, as well as alternative approaches to assessing intelligent behavior.
- **Overcoming the Limitations of Search:** This problem addresses the computational challenges associated with exhaustive search in complex game trees. It explores the exponential growth of search space and the need for alternative techniques like machine learning to handle such complexity.
- **Addressing the Challenges of Computer Vision:** This problem investigates the difficulties in developing computer vision systems that can reliably interpret and understand visual information. It examines the historical underestimation of the problem's complexity and the ongoing research efforts to overcome these challenges.
- **Mitigating AI Safety Risks:** This problem focuses on identifying and addressing potential safety risks associated with the development and deployment of AI systems. It explores the vulnerability of AI systems to adversarial attacks and the need for robust safety mechanisms.

- **Addressing Ethical Concerns in AI:** This problem explores the ethical implications of AI systems, particularly concerning bias and fairness. It examines the potential for AI systems to perpetuate or amplify existing societal biases and the need for ethical guidelines and responsible development practices.
- **Understanding the Differences Between Game Types:** This problem involves analyzing the differences between various game types, such as chess and soccer, in the context of AI. It explores how these differences impact the design and implementation of AI algorithms for playing these games.
- **Exploring the Similarities Between AI Tasks:** This problem investigates the commonalities between seemingly disparate AI tasks, such as speech synthesis and game playing. It explores the underlying principles and algorithmic components that are shared across different AI domains.
- **Understanding the AI Stack:** This problem involves understanding the different layers and components that constitute the AI stack, including machine learning, search algorithms, computer vision, and human-AI interaction.
- **Understanding Perceptrons:** This problem involves understanding the fundamental building blocks of neural networks, namely perceptrons, and how they process information.
- **Understanding Reinforcement Learning:** This problem involves understanding the principles of reinforcement learning and how it can be applied to game playing, using the example of Samuel's checkers program.
- **Understanding the Components of Game-Playing Algorithms:** This problem involves understanding the key components of algorithms designed for game playing, including state representation, action selection, and opponent modeling.

### 3 Algorithm Solutions

- **Minimax Search:** A recursive algorithm for two-player zero-sum games that explores the game tree to find the best move for the current player, assuming the opponent also plays optimally. It alternates between maximizing the score for the current player and minimizing the score for the opponent.
- **Alpha-Beta Pruning:** An optimization technique for Minimax search that reduces the search space by avoiding the evaluation of branches that cannot affect the optimal decision. It uses alpha and beta values to prune branches.
